# **CONEX-AGP Agilis- P Controller with Encoder Feedback**

### 1.0 System Overview

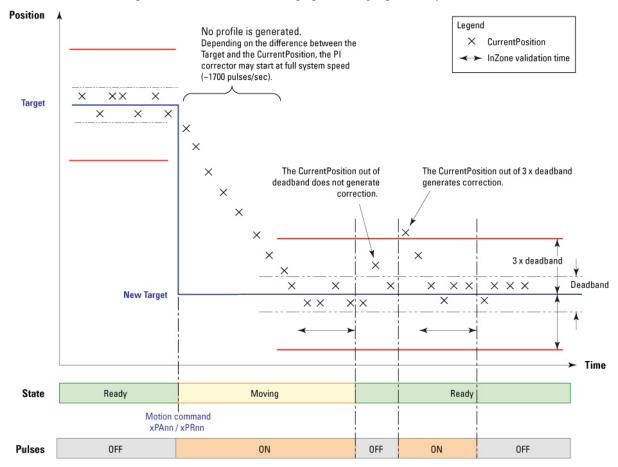

#### 1.1 General Description

The CONEX-AGP is a single axis motion controller/driver for piezo actuator with encoder feedback. It provides a very compact and low-cost solution for driving a variety of Newport Agilis-type piezo stages from a PC.

Communication with the CONEX-AGP is achieved via an USB port (requires Windows<sup>TM</sup> operating system). A Windows<sup>TM</sup> based software enables basic motion. Advanced application programming is simplified by an ASCII command interface and a set of two letter mnemonic commands.

#### 1.1.1 Encoder Theory of Operation

The encoder on the Agilis stage is generated from a proprietary marking technology that creates a pattern of fine lines directly on the stage. From these patterns, sinusoidal signals are generated which are then interpolated by the encoder electronics down to the specified resolution. The accuracy of the stage is very dependent on the quality of the pattern, which also leads to high positioning repeatability.

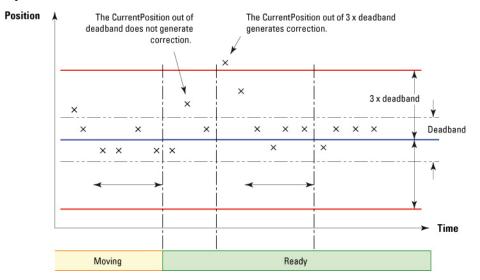

#### 1.1.2 Closed Loop Technology – Deadband Feature

The Conex closed loop algorithm for Agilis stages is a simplified version of the typical DC servo loop algorithm. Although a motion profile is not generated in the algorithm, the Conex controller still closes a loop based on the error. The larger the error, the faster the stage is commanded to move to reduce the error. The stage could start at the full system speed of 1700 pulses if the stage is far from the desired position.

To close in on a position, the motion of the stage stops when the stage is within a specified range about the desired position. This range is called the deadband and is set in firmware. The deadband is the allowable deviation from the desired position and if the stage is inside the deadband within 20ms, the stage is considered in position and stops.

NOTE

The servo loop can be disabled to eliminate any undesired correction of the position when the stage moves outside the deadband due to external sources.

### 1.2 CONEX-AGP

### 1.2.1 Delivered Items

• CONEX-xxx Controller box with stage (cable length: 1.8m)

• CONEX-USB USB cable, 1.8 m length

• CONEX-MOTION CD-Rom

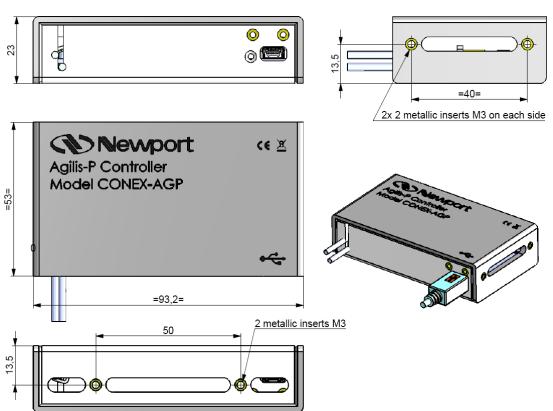

### 1.2.2 Specifications

General Description	Agilis controller with encoder feedback.					
Control Capability	Piezo motors, closed loop					
Piezo Output Voltage	35 Vpeak					
Control loop	<ul><li>Digital PI loop</li><li>100 Hz servo rate</li></ul>					
Motion	Absolute and relative motion.					
Computer interface	− USB (requires Windows <sup>TM</sup> operating system)					
Programming	<ul><li>25+ intuitive, 2-letter ASCII commands</li><li>Command set includes software limits, user units</li></ul>					
Dedicated inputs	- Analog Cosine/Sine signals from encoder.					
Status display	Two color LED					
Communication rate	50 Hz Max. (USB)					
Internal safety feature	Watchdog timer					
Consumption	+5V (USB): < 0.5A					

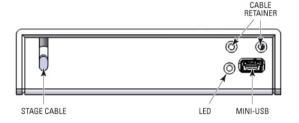

### 1.2.3 Dimensions

### 1.3 System Environmental Specifications

Operating temperature	5 °C to 40 °C			
Operating humidity	20% to 85% relative humidity, non-condensing			
Location	Indoor use only			

### 1.4 Connector Identification

USB	mini USB connector
LED	Status LED
STAGE	Stage entry cable
Cable retainer	2 x M3 threaded hole to attach cable retainer

### 1.5 USB Communication Settings

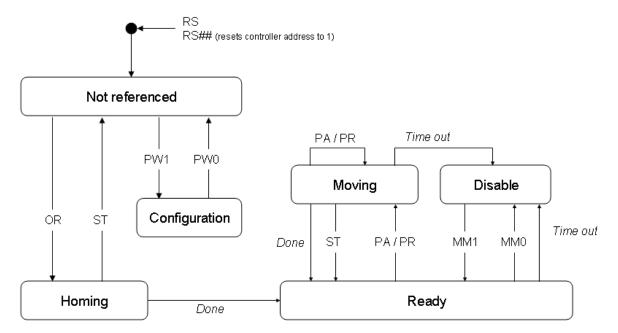

Communication parameters are preset in the CONEX-AGP controller and do not require any configuration:

Bits per second	921,600
Data bits	8
Parity	None
Stop bits	1
Flow control	Xon/Xoff
Terminator	$C_R L_F$

### 2.0 Programming

### 2.1 State Diagram

For a safe and consistent operation, the CONEX-AGP uses 6 different operational states: Not referenced, Configuration, Homing, Ready, Disable and Moving. In each state, only specific commands are accepted by the CONEX-AGP. Therefore, it is important to understand the state diagram below and which commands and actions cause transitions between the different states. See section 2.4 for additional command/state information:

#### LED display:

NOT REFERENCED: If everything is OK then SOLID ORANGE.

NOT REFERENCED: If no parameters then SOLID RED.

CONFIGURATION: SLOW BLINKING RED.

READY: SOLID GREEN.

DISABLE: SLOW BLINKING GREEN.
HOMING: FAST BLINKING GREEN.
MOVING: FAST BLINKING GREEN.

When powering the CONEX-AGP, the controller starts initialization. When the initialization is successful, the controller goes to the NOT REFERENCED state. From the NOT REFERENCED state, the controller can go to the CONFIGURATION state using the PW1 command. In the CONFIGURATION state, the CONEX-AGP allows changes to all configuration parameters, like corrector coefficients or travel limits. The PW0 command saves all changes to the controller's memory and returns the controller back to the NOT REFERENCED state.

To execute any move commands (PA, PR), the controller must be in the READY or MOVING states. To get from the NOT REFERENCED state to the READY state, the positioner must be homed first with the OR command. During homing (OR command execution), the controller is in HOMING state. When homing is successful, the controller automatically goes to the READY state. The process for homing and the signals utilized during homing can be defined with the HT command.

In the READY state, the control loop is closed. During a move execution (PA/PR), the controller is in the MOVING state and goes automatically back to the READY state when the move is completed. A time out error during a move changes the controller to the DISABLE state.

In the DISABLE state, the control loop is open. But the encoder is still read and the current position gets updated. The DISABLE state can be used to make sure that the control loop will not generate any corrective motion command (due to noise or little drift) while at a given position. To go from the READY state to the DISABLE state and vice versa, use the MM command.

To get from the READY or DISABLE states back to the NOT REFERENCED state, to make some further parameter changes in CONFIGURATION state, for example, you need to reboot the controller with the RS command.

#### 2.2 Command Syntax

The CONEX-AGP is a command driven controller. The general format of a command is a two letter ASCII character preceded and followed by parameters specific to the command:

#### **Command format:**

**nn** — Optional or required controller address.

AA — Command name.

**xx** — Optional or required value or "?" to query current value.

Both, upper and lower case characters are accepted. Depending on the command, it can have an optional or required prefix  $(\mathbf{nn})$  for the controller address and/or a suffix  $(\mathbf{xx})$  value or a "?".

#### Blank spaces

Blanks are allowed and ignored in any position, including inside a numerical value. The following two commands are equivalent, but the first example might be confusing and uses more memory:

2P A1.43 6

2PA1.436

#### **Decimal separator**

A dot (".") is used as decimal separator for all numerical values.

#### Command terminator

Commands are executed as the command terminator  $C_RL_F$  (carriage-return line-feed, ASCII 13 and ASCII 10) is received. The controller will analyze the received string. If the command is valid and its parameters are in the specified range, it will be executed. Otherwise it will memorize an error.

After the execution of the command, all remaining characters in the input string, if any, will be ignored. In particular, it is not possible to concatenate several commands on a single string from the PC to the CONEX-AGP

Each command will handle the memorization of related errors that can be accessed with the TE command properly. Please refer to the command set in section 2.4 for details.

#### 2.3 Command Execution Time

The CONEX-AGP controller interprets commands continuously as received. The typical execution time for a "tell position command" (nTP?) is about 10 ms. Here, command execution time means the time from sending the command until receipt of the answer.

It is important to note that a move command, that may last for several seconds, will not suspend the controller from further command execution. For an efficient process flow with many move commands, it is recommended to query the controller status (TS command) or the current position (TP command) before any further motion command is sent.

#### 2.4 Command Set

This section describes the supported two-letter ASCII commands used to configure and operate the CONEX-AGP. The general command format is:

#### **Command format:**

**nn** — Optional or required controller address.

**AA** — Command name.

**xx** — Optional or required value or "?" to query current value.

Most commands can be used to set a value (in that case the command name is followed by the value "xx") or to query the current value (in that case the command name is followed by a "?"). When querying a value, the controller responds with the command it received followed by the queried value. For example, a 1LF20 sets the low pass filter frequency of the controller #1 to 20Hz. A 1LF? sends the response 1LF20.

Not every command can be executed in all states of the CONEX-AGP and some commands have different meanings in different states. It is therefore important to understand the state diagram of the controller, see section 2.1.

	Not Ref.	Config.	Disable	Ready	Motion	Description
DB		0		-	_	Set/Get corrector deadband
HT		0	_	-	_	Set/Get HOME search type
ID		0		-	_	Set/Get stage identifier
IF		0		-	_	Set/Get interpolation factor
KI		0		-	-	Set/Get integral gain
KP		0		-	-	Set/Get proportional gain
LF		0		-	_	Set/Get low pass filter frequency
MM	-	-	•	•	-	Enter/Leave DISABLE state
OR	•	_	_	-	_	Execute HOME search
PA	-	-	_	•	•	Move absolute
PR	-	_	_	•	•	Move relative
PW	•	•	_	-	_	Enter/Leave CONFIGURATION state
RS	•	•	•	•	•	Reset controller
RS##	<b>#</b> •	•	•	•	•	Reset controller's address to 1
SA	-	0	_	-	_	Set/Get controller's RS-485 address
SL	-	0			_	Set/Get negative software limit
SR	-	0			-	Set/Get positive software limit
ST	-	-	_	-	•	Stop motion
SU	-	0	_	-	_	Set/Get encoder increment value
TB	•	•	•	•	•	Get command error string
TE	•	•	•	•	•	Get last command error
TH	•	•	•	•	•	Get target position
TP	•	•	•	•	•	Get current position
TS	•	•	•	•	•	Get positioner error and controller state
VE	•	•	•	•	•	Get controller revision information
ZT	•	•	•	_	_	Get all controller parameters

**Motion:** Corresponds to HOMING and MOVING state (for details see state

diagram, section 2.1).

O Changes configuration parameters. Those changes will be stored in the

controller's memory with the PW1 command and remain available after

switching off the controller.

☐ Changes working parameters only. Those changes will get lost when

switching off the controller.

Accepted command.

Write command not accepted (will return an error).

**Command:** Command passed without preceding controller number applies to all

controllers (e.g. MM0 disables all controllers).

### DB — Set/Get corrector deadband

Disable Usage Not Ref. Config. Ready Motion 0 **Syntax** xxDBnn or xxDB? **Parameters Description** xx [int] Controller address. Deadband value. **nn** [float] 1 to 31 Range  $\mathbf{x}\mathbf{x}$  $\geq$  0 and < 0.05 nn Units None  $\mathbf{x}\mathbf{x}$ Preset units nn **Defaults** Missing: Error B.  $\mathbf{x}\mathbf{x}$ Out of range: Error B. Floating point: Error A. nn Missing: Error C. Error C. Out of range: **Description** The deadband parameter defines an area, around a set position, in which the controller will not try to make any more corrections. This is useful to prevent the corrector from generating unwanted motion, for example because of noise on the encoder. Returns If the sign "?" takes place of **nn**, this command returns the current programmed value. **Errors** Unknown message code or floating point controller address. В Controller address not correct. C Parameter missing or out of range. Execution not allowed. D K Execution not allowed in READY state. Execution not allowed in HOMING state. L M Execution not allowed in MOVING state. Rel. Commands KI Set the integral gain. KP Set the proportional gain. Example1DB0.000075 Set controller #1 deadband to 75nm (in the case of a translation stage).

### HT — Set/Get HOME search type

Usage	Not Ro	ef.	Config.	Disable	Ready	Motion				
			0	_	_	-				
Syntax	xxHTnn	or xxF	IT?							
Parameters										
Description	xx [int]	_	Controller a	Controller address.						
	nn [int]	_	Home type value.							
Range	XX	_	1 to 31							
	nn	_	1 use curren	t position as l	HOME.					
			4 use negati	ve end of run	as HOME					
			5 end of run	offset initiali	zation					
Units	XX	_	None.							
	nn	_	None.							
Defaults	xx Mis	sing:	Error B.							
	Out of ra	ange:	Error B.							
	Floating p	point:	Error A.							
	nn Mis	sing:	Error C.							
	Out of ra	ange:	Error C.							
Description	This com	mand s	sets the type o	f HOME sear	ch used with t	he OR command.				
	end of ru encoder s	ın, but signal.	a position a This position	little away f is stored in t	rom it define	ge does not use the mechanical d by a precise position of the memory the first time the stage the user.				
	Mode 5 is	s a mai	ntenance mod	le and must be	e used by New	port service personnel only.				
		rites.	Im number of times that parameter can be stored to the memory is limited. Unit failure due to excessive use of the command is not covered by							
Returns	If the sign	n "?" ta	akes place of 1	nn, this comm	nand returns th	ne current programmed value.				
Errors	A	_	Unknown m	nessage code o	or floating poi	nt controller address.				
	В	_	Controller a	ddress not co	rrect.					
	C	_	Parameter n	nissing or out	of range.					
	D	_	Execution not allowed.							
	J	_	Execution n	ot allowed in	DISABLE sta	ite.				
	K	_	Execution n	ot allowed in	READY state					
	L	_	Execution n	ot allowed in	HOMING sta	te.				
	M	_	Execution n	ot allowed in	MOVING sta	te.				
Rel. Commands	OR	_	Execute HO	ME search.						
Example	1HT	1	Set controlle	er #1 HOME	sequence to us	se current position as home.				

## ID — Set/Get stage identifier

Usage	Not Ref.	Config.	Disable	Ready	Motion	
		0		-	_	
Syntax	xxIDnn or xxII	<b>)</b> ?				
<b>Parameters</b>						
Description	xx [int] —	Controller	address.			
	nn [char] —	Stage mod	del number.			
Range	xx —	1 to 31				
	nn —	1 to 31 AS	SCII characters.			
Units	xx —	None				
	nn —	None				
Defaults	<b>xx</b> Missing:	Error B.				
	Out of range:	Error B.				
	Floating point:	Error A.				
	nn Missing: Error C.					
	Out of range:	Error C.				
Description	The ID? common allow				ONFIGURATION mode, the	nis
Returns	If the sign "?" t	akes place o	f <b>nn</b> , this comm	nand returns t	ne current programmed value.	
Errors	Α —	Unknown	message code	or floating po	int controller address.	
	В —	Controller	address not co	rrect.		
	C —	Parameter	missing or out	of range.		
	D —	Execution	not allowed.			
	н —	Execution	not allowed in	NOT REFER	ENCED state.	
	J —	Execution	not allowed in	DISABLE st	ate.	
	К —	Execution	not allowed in	READY state	2.	
	L —	Execution	not allowed in	HOMING sta	nte.	
	М —	Execution	not allowed in	MOVING sta	ite.	
Rel. Commands	ZT —	Get config	guration parame	eters.		
Example	1ID?	Get stage identifier for controller #1.				
11	Control	ler returns prod	luct namer: C	ONEX-AGP.		

# IF — Set/Get interpolation factor

Usage	Not Ref.	Config.	Disable	Ready	Motion		
		0		-	_		
Syntax	xxIFnn or xxII	?					
<b>Parameters</b>							
Description	xx [int] —	Controller	address.				
	nn [float] —	Hysteresis	s value.				
Range	<b>xx</b> —	1 to 31					
	nn —	> <b>0</b> and <	<b>≔ 2000</b>				
Units	<b>xx</b> —	None					
	nn —	None					
Defaults	<b>xx</b> Missing:	Error B.					
	Out of range:	Error B.					
	Floating point:	Error A.					
	nn Missing:	Error C.					
	Out of range:	Error C.					
Description					rpolation defines the number by erpolated resolution.		
Returns	If the sign "?" t	akes place o	of <b>nn</b> , this comm	nand returns t	he current programmed value.		
Errors	Α —	Unknown	message code	or floating po	int controller address.		
	В —	Controller	address not co	rrect.			
	C —	Parameter	missing or out	of range.			
	D —	Execution	not allowed.				
	К —	Execution	not allowed in	READY state	e.		
	L —	Execution	not allowed in	HOMING sta	ate.		
	М —	Execution	not allowed in	MOVING sta	ate.		
Rel. Commands	SU —	Set/Get er	ncoder resolution	on			
Example	1IF1000	Set contro	oller #1 interpo	lation factor to	o 1000.		

### KI — Set/Get integral gain

Syntax xxKInn or xxKI?  Parameters  Description xx [int] — Controller address.	Usage	Not Ref.	Config.	Disable	Ready	Motion		
Parameters  Description			0		_	_		
Description       xx [int]       — Controller address.         nn [float]       — Integral gain value.         Range       xx       — 1 to 31         nn       — ≥ 0 and <= 3000	Syntax	xxKInn or xxK						
nn [float] — Integral gain value.  Range xx — 1 to 31 nn — ≥0 and <= 3000  Units xx — None. nn — Volt * preset unit/second.  Defaults xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Description  In CONFIGURATION state, this command sets the integral gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state.  In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns  Returns  Returns  A — Unknown message code or floating point controller address. B — Controller address not correct. C — Parameter missing or out of range. D — Execution not allowed. K — Execution not allowed in READY state. L — Execution not allowed in HOMING state. M — Execution not allowed in MOVING state.	<b>Parameters</b>							
Range xx — 1 to 31 nn — ≥0 and <= 3000  Units xx — None. nn — Volt * preset unit/second.  Defaults xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Description In CONFIGURATION state, this command sets the integral gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state.  In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns If the sign "?" takes place of nn, this command returns the current programmed value.  Errors A — Unknown message code or floating point controller address.  B — Controller address not correct.  C — Parameter missing or out of range.  D — Execution not allowed.  K — Execution not allowed in READY state.  L — Execution not allowed in HOMING state.  M — Execution not allowed in MOVING state.	Description	xx [int] —	Controller	address.				
nn — ≥0 and <= 3000  Units xx — None. nn — Volt * preset unit/second.  Defaults xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Out of range: Error C.  Description In CONFIGURATION state, this command sets the integral gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state.  In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns If the sign "?" takes place of nn, this command returns the current programmed value.  Errors A — Unknown message code or floating point controller address.  B — Controller address not correct.  C — Parameter missing or out of range.  D — Execution not allowed.  K — Execution not allowed in READY state.  L — Execution not allowed in HOMING state.  M — Execution not allowed in MOVING state.		nn [float] —	Integral ga	in value.				
Units xx — None. nn — Volt * preset unit/second.  Defaults xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Out of range: Error C.  The Configuration is also the default value that will be used unless a different value is set in DISABLE state. In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns If the sign "?" takes place of nn, this command returns the current programmed value.  Errors A — Unknown message code or floating point controller address.  B — Controller address not correct. C — Parameter missing or out of range. D — Execution not allowed. K — Execution not allowed in READY state. L — Execution not allowed in HOMING state. M — Execution not allowed in MOVING state.	Range	xx —	1 to 31					
nn — Volt * preset unit/second.  xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Description In CONFIGURATION state, this command sets the integral gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state.  In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns If the sign "?" takes place of nn, this command returns the current programmed value.  Errors A — Unknown message code or floating point controller address. B — Controller address not correct. C — Parameter missing or out of range. D — Execution not allowed. K — Execution not allowed in READY state. L — Execution not allowed in HOMING state. M — Execution not allowed in MOVING state.		nn —	$\geq$ 0 and $\leq$	= 3000				
Defaults xx Missing: Error B. Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C.  Description In CONFIGURATION state, this command sets the integral gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state.  In DISABLE state, this command allows setting a new working parameter for the integral gain. This value is not saved in the controller's memory and will be lost after reboot.  Returns If the sign "?" takes place of nn, this command returns the current programmed value. Rel. Commands KP — Set proportional gain.	Rel. Commands	KP —	Set propor	tional gain.				

Set controller #1 integral gain to 800.

Example

1KI800 |

### **KP** — Set/Get proportional gain

Usage Not Ref. Config. Disable Ready Motion 0 **Syntax** xxKPnn or xxKP? **Parameters Description** xx [int] Controller address. Proportional gain value. **nn** [float] 1 to 31 Range  $\mathbf{x}\mathbf{x}$  $\geq$  **0** and < **3000** nn Units XXNone. Volt/preset unit nn **Defaults** Missing: Error B.  $\mathbf{x}\mathbf{x}$ Out of range: Error B. Floating point: Error A. nn Missing: Error C. Out of range: Error C. **Description** In CONFIGURATION state, this command sets the proportional gain of the PI control loop which can than be saved in the controller's nonvolatile memory using the PW command. It is also the default value that will be used unless a different value is set in DISABLE state. In DISABLE state, this command allows setting a new working parameter for the proportional gain. This value is not saved in the controller's memory and will be lost after reboot. Returns If the sign "?" takes place of **nn**, this command returns the current programmed value. **Errors** Unknown message code or floating point controller address. В Controller address not correct. C Parameter missing or out of range. D Execution not allowed. K Execution not allowed in READY state. Execution not allowed in HOMING state. L Execution not allowed in MOVING state. M Rel. Commands Set integral gain. ΚI 1KP10 | **Example** Set controller #1 proportional gain to 10.

## LF — Set/Get low pass filter frequency

Usage	N	ot Ref.		Config.	Disable	Ready	Motion			
				0		_	_			
Syntax	xxL	Fnn or	xxLF	?						
<b>Parameters</b>										
Description	xx [	int] -	_	Controller a	ddress.					
	nn [	float] -	_	Friction con	npensation va	ılue.				
Range	XX	-	_	1 to 31						
	nn	-	_	> 0 and <=	1000					
Units	XX	-	_	None.						
	nn	-	_	Hertz.						
Defaults	XX	Missin	g:	Error B.						
	Ou	t of rang	e:	Error B.						
	Floa	ting poi	nt:	Error A.						
	nn	Missin	g:	Error C.						
	Ou	t of rang	e:	Error C.						
Description				sets the low optical encode	-	equency used	on both sine and cosine inputs			
Returns	If	the sign	"?" t	akes place of	f <b>nn</b> , this con	nmand returns	s the current programmed value.			
Errors	A	-	_	Unknown m	nessage code	or floating po	int controller address.			
	В	-	_	Controller a	ddress not co	rrect.				
	C	-	_	Parameter m	nissing or out	of range.				
	D	-	_	Execution n	ot allowed.					
	K	-	_	Execution n	ot allowed in	READY stat	e.			
	L	-	_	Execution n	ot allowed in	HOMING st	ate.			
	M	-	_	Execution n	ot allowed in	MOVING st	ate.			
Example		1LF10		Set controlle	er #1 low pas	s filter to 10H	Iz.			

### MM — Enter/Leave DISABLE state

Config. Not Ref. Disable Ready Motion Usage **Syntax** xxMMnn or xxMM? **Parameters Description** xx [int] Controller address. Velocity feed forward value. nn [float] 0 to 31 Range XX **0** changes state from READY to DISABLE. nn 1 changes state from DISABLE to READY. Units None. XX None. nn **Defaults** Change to 0. Missing:  $\mathbf{X}\mathbf{X}$ Out of range: Error B. Floating point: Error A. Missing: Error C. Error C. Out of range:

**Description** 

When the MM command is sent without preceding controller number or the controller number is 0, the MM command gets executed on all controllers.

MM0 changes the controller's state from READY to DISABLE. In DISABLE state the control loop is open. The encoder, though, is still read and the current position gets updated.

MM1 changes the controller's state from DISABLE to READY. The controller's set point position is set equal to its current position and the control loop gets closed.

Returns

If the sign "?" takes place of **nn**, this command returns the current controller state (ef).

#### **Controller states (ef):**

- 0A: NOT REFERENCED from reset.
- 0B: NOT REFERENCED from HOMING.
- 0C: NOT REFERENCED from CONFIGURATION.
- 0D: NOT REFERENCED from DISABLE.
- 0E: NOT REFERENCED from READY.
- 0F: NOT REFERENCED from MOVING.
- 10: NOT REFERENCED no parameters.
- 14: CONFIGURATION.
- 1E: HOMING.
- 28: MOVING.
- 32: READY from HOMING.
- 33: READY from MOVING.
- 34: READY from DISABLE.
- 3C: DISABLE from READY.
- 3D: DISABLE from MOVING.

**Errors** A — Unknown message code or floating point controller address.

B — Controller address not correct.

 $\mathbf{C}$ Parameter missing or out of range. D Execution not allowed. Η Execution not allowed in NOT REFERENCED state. Execution not allowed in CONFIGURATION state. I L Execution not allowed in HOMING state. M Execution not allowed in MOVING state. Enter/leave CONFIGURATION state. **Rel. Commands** Example All controllers go to DISABLE state MM0MM?

MM3C

### **OR** — Execute HOME search

Usage	Not Ref.	Config.	Disable	Ready	Motion
Syntax	• xxOR	-	_	_	_
Parameters					
Description	xx [int] —	Controller	address.		
Range	xx —	1 to 31			
Units	<b>xx</b> —	None.			
Defaults	<b>xx</b> Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
	nn Missing:	Error C.			
	Out of range:	Error C.			
Description	This command command.	starts the	execution of	the HOME s	search as defined by the HT
				-	ystem start, any positioner must er motion commands can get
	The OR comma	and gets accep	pted only in No	OT REFEREN	ICED state.
Errors	Α —	Unknown 1	message code	or floating poi	nt controller address.
	В —	Controller	address not co	rrect.	
	C —	Parameter	missing or out	of range.	
	D —	Execution	not allowed.		
	I —	Execution	not allowed in	CONFIGURA	ATION state.
	J	Execution	not allowed in	DISABLE sta	ite.
	К —	Execution	not allowed in	READY state	·.
	L —	Execution	not allowed in	HOMING sta	te.
	М —	Execution	not allowed in	MOVING sta	te.
Rel. Commands	нт —	Set HOME	search type.		
Example	1OR	Execute 1	HOME search	with controlle	r #1.

### PA — Move absolute

Usage	Not Ref.	Config.	Disable	Ready	Motion
	_	_	_	•	•
Syntax	xxPAnn or xxP	PA?			
Parameters					
Description	xx [int] —	Controller			
	nn [float] —	New targe	t position.		
Range	<b>xx</b> —	1 to 31			
	nn —	> SL and	< SR		
Units	<b>xx</b> —	None.			
	nn —	Preset unit	S.		
Defaults	xx Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
	nn Missing:	Error C.			
	Out of range:	Error C.			
Description	The PA comma to the new target			ove. When rec	eived, the positioner will move
		tion is higher	r or equal to the		MOVING state, AND when the tware limit (SL), AND lower or
Returns	If the sign "?" t	akes place of	f <b>nn</b> , this comn	nand returns tl	he target position value.
Errors	Α —	Unknown	message code	or floating poi	int controller address.
	В —	Controller	address not co	rrect.	
	С —	Parameter	missing or out	of range.	
	D —	Execution	not allowed.		
	G —	Target pos	ition out of lin	nits.	
	н —	Execution	not allowed in	NOT REFER	ENCED state.
	I —	Execution	not allowed in	CONFIGUR	ATION state.
	J	Execution	not allowed in	DISABLE sta	ate.
Rel. Commands	PR —	Move rela	tive.		
	TH —	Get target	position.		
	TP —	Get curren	t position.		
	SU —	Set encode	er increment va	lue.	
Example	1PA2.2	Move posi	tioner on contr	oller #1 to ab	solute position 2.2 units.

### PR — Move relative

Usage	Not Ref.	Config.	Disable	Ready	Motion	
G. A	_ 	_	_	•	•	
Syntax	xxPRnn					
Parameters  Description	ww [int]	Controllor	, addmaa			
Description	xx [int] —	Controller				
Danga	nn [float] —	Displacem  1 to 31	ient.			
Range	nn —	> SL and	∠ CD			
Unita	****		> SK			
Units		None.	ta			
Defaults	nn —	Preset uni Error B.	ıs.			
Defaults	xx Missing:					
	Out of range: Floating point:	Error B. Error A.				
	nn Missing:	Error C.				
	Out of range:	Error C.				
Description	_		a ralativa mava	When receive	ved, the positioner will mo	vo to
Description	a new target po				<u> </u>	ve to
		-	• •		IOVING state, AND when	
Returns	If the sign "?" t	takes place o	f <b>nn</b> , this comn	nand returns tl	ne target position value.	
Errors	Α —	Unknown	message code	or floating poi	nt controller address.	
	В —	Controller	address not co	rrect.		
	C —	Parameter	missing or out	of range.		
	D —	Execution	not allowed.			
	G —	Displacen	nent out of limi	ts.		
	н —	Execution	not allowed in	NOT REFER	ENCED state.	
	I —	Execution	not allowed in	CONFIGURA	ATION state.	
	J —	Execution	not allowed in	DISABLE sta	ite.	
Rel. Commands	PA —	Move abso	olute.			
	тн —	Get target	position.			
	TP —	Get currer	nt position.			
	SU —	Set encode	er increment va	lue.		
Example	1PR2.2	Move po	ositioner on co	ntroller #1 to	a new position 2.2 units	away

from the current target position.

### PW — Enter/Leave CONFIGURATION state

Usage	Not Ref.	Config.	Disable	Ready	Motion
Syntax Parameters	xxPWnn or xxl	PW?	-	_	-
Description	xx [int] —	Controller	addrass		
Description	nn [float] —	Mode.	address.		
Range	$\mathbf{x}\mathbf{x}$ —	1 to 31			
Kange	nn —		NOT REFER	FNCFD state	to CONFIGURATION state.
					NOT REFERENCED state.
Units	xx —	None.	I CON IOUN	ATTOM State to	THOT KEI EKEIVEED state.
Cints	nn —	None.			
Defaults	xx Missing:	Error B.			
Delauts	Out of range:	Error B.			
	Floating point:	Error A.			
	nn Missing:	Error C.			
	Out of range:	Error C.			
Description	PW1 changes the controller's state from NOT REFERENCED to CONFIGURATION. In Configuration state all parameter settings are saved in the controller's memory at remain available after switching off the controller. In addition, some settings are on possible in CONFIGURATION state (e.g. set encoder increment value, etc.).				n the controller's memory and ddition, some settings are only
		ne controlle	r. After that	, it changes	otable, saves them in the flash the controller's state from
	The execution controller will r				seconds. During that time the
Returns	If the sign "?" t	akes place of	f <b>nn</b> , this comn	nand returns th	e current state.
Errors	Α —	Unknown	message code	or floating poi	nt controller address.
	В —	Controller	address not co	rrect.	
	С —	Parameter	missing or out	of range.	
	D —	Execution	not allowed.		
	J —	Execution	not allowed in	DISABLE sta	te.
	К —	Execution	not allowed in	READY state	
	L —	Execution	not allowed in	HOMING star	te.
	М —	Execution	not allowed in	MOVING star	te.
Rel. Commands	MM —	Enter/Leav	ve DISABLE s	tate.	
Example	1PW1	Changes c	ontroller #1 to	CONFIGURA	TION state.

#### NOTE

The PW command is limited to 100 writes. Unit failure due to excessive use of the PW command is not covered by warranty.

The PW command is used to change the configuration parameters that are stored in memory, and not parameters that are needed to be changed on the fly.

### **RS** — Reset controller

Usage	Not	Ref.	Config.	Disable	Ready	Motion	
		•	•	•	•	•	
Syntax	xxRS						
Parameters							
Description	xx [in	t] —	Controller	address.			
Range	XX	_	1 to 31				
Units	XX	_	None.				
Defaults	xx 1	Missing:	Error B.				
	Out	of range:	Error B.				
	Floati	ng point:	Error A.				
Description	The R	S comma	nd issues a h	ardware reset o	of the controll	er, equivalent to a power-up	p.
	first re	eset the co	ntroller with	the RS comm	and, and ther	ATION state, it is also need to change the controller's CONFIGURATION.	
Errors	A	_	Unknown	message code	or floating po	int controller address.	
	В	_	Controller	address not co	rrect.		
	D	_	Execution	not allowed.			
Example		1RS	Reset cont	roller #1.			

### RS## — Reset controller's address

Usage	Not R	Ref.	Config.	Disable	Ready	Motion
	•		•	•	•	•
Syntax	xxRS##	or RS#	<del>!</del> #			
Parameters						
Description	xx [int]		Axis numb	er.		
Range	XX		0 to 31			
Units	XX		None.			
Defaults	xx Mi	ssing:	Change to	0.		
	Out of 1	ange:	Error B.			
	Floating	point:	Error A.			
Description		for ea				o 1. This address needs to be on a RS-485 communication
Returns						
Errors	A	_	Unknown r	nessage code	or floating poi	nt controller address.
	В	_	Controller	address not co	rrect.	
	D	_	Execution	not allowed.		
	Н	_	Execution	not allowed in	NOT REFER	ENCED state.
	J	_	Execution	not allowed in	DISABLE sta	ate.
	K	_	Execution	not allowed in	READY state	<b>).</b>
	L	_	Execution	not allowed in	HOMING sta	ite.
	M	_	Execution	not allowed in	MOVING sta	te.
Example	RS	##	Reset contr	oller's addres	es to 1.	

### SA — Set/Get controller's RS-485 address

Usage	Not Ref.	Config.	Disable	Ready	Motion
	_	0	_	_	_
Syntax	xxSAnn or xxS	A?			
Parameters					
Description	xx [int] —	Axis numb	oer.		
	nn [int] —	Controller	's axis number.		
Range	<b>xx</b> —	1			
	nn —	2 to 31			
Units	<b>xx</b> —	None.			
	nn —	None.			
Defaults	xx Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
	nn Missing:	Error C.			
	Out of range:	Error C.			
Description	The SA common when the control				s. This address is ONLY used ation.
					software for all controller when not using this software.
Returns	If the sign "?" t	akes place of	nn, this comm	and returns th	ne current programmed value.
Errors	Α —	Unknown	message code o	or floating poi	int controller address.
	В —	Controller	address not con	rect.	
	C —	Parameter	missing or out	of range.	
	D —	Execution	not allowed.		
	н —	Execution	not allowed in	NOT REFER	ENCED state.
	J	Execution	not allowed in	DISABLE sta	ate.
	К —	Execution	not allowed in	READY state	
	L —	Execution	not allowed in	HOMING sta	ite.
	М —	Execution	not allowed in	MOVING sta	ite.
Example	1SA3	Set control	ller's RS-485 a	ddress to 3.	

Usage

Not Ref.

Config.

Motion

### SL — Set/Get negative software limit

Ready

Usage	Not Kei.	Connig.	Disable	Reauy	MUUUII			
	_	0			_			
Syntax	xxSLnn or xxS	L?						
<b>Parameters</b>								
Description	xx [int] —	Controller	address.					
	nn [float] —	Negative s	software limit.					
Range	<b>xx</b> —	1 to 31						
	nn —	> -10 <sup>12</sup> ar	$d \leq 0$					
Units	<b>xx</b> —	None.						
	nn —	Preset uni	ts.					
Defaults	<b>xx</b> Missing:	Error B.						
	Out of range:	Error B.	Error B.					
	Floating point:	Error A.	Error A.					
	nn Missing:	Error C.						
	Out of range:	Error C.						
Description	than be saved i	n the control	ler's nonvolati	le memory us	gative software limit sing the PW comman t value is set in DI	d. It is also		
	In DISABLE or READY state, this command allows setting a new working parameter for the negative software limit. It must be lower or equal to the target position. This value is not saved in the controller's memory and will be lost after reboot.							
	possibility to d rotation stage,	isable softwa set the lov e" (see SU	nre limits. For west possible command). Fo	an almost inf value, which	ge of a positioner. Trinite motion, for instance is: -2147000000 the encoder increme	ance with a * "encoder		
D . 4	TC 41	TC 4						

Disable

If the sign "?" takes place of nn, this command returns the current programmed value.

**Errors** Unknown message code or floating point controller address.

> В Controller address not correct.

 $\mathbf{C}$ Parameter missing or out of range.

D Execution not allowed.

Execution not allowed in NOT REFERENCED state. Η

Execution not allowed in HOMING state. L

Execution not allowed in MOVING state. M

Rel. Commands Set positive software limit. SR

> 1SL-100 Set controller #1 negative software limit to −100 units. Example

### SR — Set/Get positive software limit

Usage	Not Ref.	Config.	Disable	Ready	Motion	
	_	0			_	
Syntax	xxSRnn or xxS	SR?				
<b>Parameters</b>						
Description	xx [int] —	Controller	r address.			
	nn [float] —	Positive s	oftware limit.			
Range	<b>xx</b> —	1 to 31				
	nn —	$\geq 0$ and $\leq$	$\leq 10^{12}$			
Units	xx —	None.				
	nn —	Preset uni	ts.			
Defaults	xx Missing:	Error B.				
	Out of range:	Error B.				
	Floating point:	Error A.				
	nn Missing:	Error C.				
	Out of range:	Error C.				
Description	than be saved i	n the contro	ller's nonvolati	le memory us	ositive software limit which can sing the PW command. It is also t value is set in DISABLE or	)
	In DISABLE or READY state, this command allows setting a new working parameter for the positive software limit. It must be larger or equal to the target position. This value is not saved in the controller's memory and will be lost after reboot.					
	possibility to d rotation stage,	isable software set the late where the set set set set set set set set set se	are limits. For rgest possible command). Fo	an almost inf value, whic	ge of a positioner. There is no inite motion, for instance with a h is: 2147000000 * "encoder the encoder increment value is	a r
Returns	If the sign "?"	takes place o	of <b>nn</b> this com	mand returns t	he current programmed value.	

**Errors** 

Unknown message code or floating point controller address.

В

C

Controller address not correct.

Example

Set controller #1 positive software positive to 100 units.

## ST — Stop motion

Usage	Not Ref.	Config.	Disable	Ready	Motion
	_	_	_	_	•
Syntax	[xx]ST				
<b>Parameters</b>					
Description	xx [int] —	Controller	address.		
Range	<b>xx</b> —	0 to 31			
Units	<b>xx</b> —	None.			
Defaults	<b>xx</b> Missing:	Change to	0.		
	Out of range:	Error B.			
	Floating point:	Error A.			
Description		The ST comm			s stops a move in progress on troller address stops the moves
Errors	Α —	Unknown	message code	or floating po	int controller address.
	В —	Controller	address not co	orrect.	
	D —	Execution	not allowed.		
	Н —	Execution	not allowed in	NOT REFER	RENCED state.
	I —	Execution	not allowed in	CONFIGUR	ATION state.
Example	ST	Stop move.	s on all contro	llers.	

### SU — Set/Get encoder increment value

Usage	Not Ref.	Config.	Disable	Ready	Motion
	_	0	_	_	_
Syntax	xxSUnn or xxS	U?			
<b>Parameters</b>					
Description	xx [int] —	Controller	address.		
	nn [float] —	Equivalent	units to one e	ncoder count.	
Range	<b>xx</b> —	1 to 31			
	nn —	$> 10^{-6}$ and	$< 10^{12}$		
Units	<b>xx</b> —	None.			
	nn —	Units.			
Defaults	xx Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
	nn Missing:	Error C.			
	Out of range:	Error C.			
Description		er parameters	like travel lir		t. It defines also the system of efore, it is the first parameter to
	Example: For xxSU0.001 sets	-			ion of 1 $\mu$ m, the command 1 unit = 1 mm.
Returns	If the sign "?" ta	akes place of	nn, this comm	nand returns th	ne current programmed value.
Errors	Α —	Unknown r	nessage code	or floating poi	nt controller address.
	В —	Controller	address not co	rrect.	
	С —	Parameter i	missing or out	of range.	
	D —	Execution 1	not allowed.		
	Н —	Execution 1	not allowed in	NOT REFER	ENCED state.
	J —	Execution 1	not allowed in	DISABLE sta	ate.
	К —	Execution 1	not allowed in	READY state	2.
	L —	Execution i	not allowed in	HOMING sta	ite.
	М —	Execution 1	not allowed in	MOVING sta	ite.
Example	1SU7.5e-6	Set control	ler #1 encoder	· increment to	$7.5 * 10^{-6}$ units.

### TB — Get command error string

Usage	Not Ref.	Config. Disable Ready Motion
	•	• • • •
Syntax	xxTBnn	
<b>Parameters</b>		
Description	xx [int] —	Controller address.
Range	<b>xx</b> —	1 to 31
	nn [char] —	Error code (refer to TE command).
Units	<b>xx</b> —	None.
Defaults	<b>xx</b> Missing:	Error B.
	Out of range:	Error B.
	Floating point:	Error A.
	nn Missing:	Returns explanation of current error.
	Out of range:	Error C.
Description		and returns a string that explains the meaning of the error code <b>nn</b> (see or complete list).
Errors	Α —	Unknown message code or floating point controller address.
	В —	Controller address not correct.
	С —	Parameter missing or out of range.
	D —	Execution not allowed.
Rel. Commands	TE —	Get error code.
Example	1TB@	Get explanation to error code @.

1TB@ No error | Controller returns: @ = means no error.

### TE — Get last command error

Usage	Not Ref.	Config.	Disable	Ready	Motion
	•	•	•	•	•
Syntax	xxTE				
<b>Parameters</b>					
Description	xx [int] —	<ul> <li>Controlle</li> </ul>	r address.		
Range	xx —	- 1 to 31			
Units	xx —	- None.			
Defaults	xx Missing	Error B.			
	Out of range	Error B.			
	Floating poin	t: Error A.			
Description	executable, it the execution will return @	t memorizes a of a TE com means no on mand error i	n error. This er mand, the error error. When a	ror can be rea buffer gets en new comman	cror. When a command is not d with the TE command. After rased and another TE command d error is generated before the rror will overwrite the current
	For a safe preach comman	-	t is recommend	ed to always	query the command error after
Errors	Α –	- Unknown	message code	or floating poi	nt controller address.
	В –	<ul> <li>Controlle</li> </ul>	r address not co	rrect.	
	D –	<ul> <li>Execution</li> </ul>	not allowed.		
Rel. Commands	TB –	<ul> <li>Get error</li> </ul>	string.		
Example	1TE	Get last e	rror memorizea	l on controller	#1.
		Controlle	r returns: 1TE0	@, means no e	rror.
	List of errors	and correspon	nding strings (se	e TB commar	nd):
	@ _	<ul> <li>No error.</li> </ul>			
	Α –	- Unknown	message code	or floating poi	nt controller address.
	В –	<ul> <li>Controlle</li> </ul>	r address not co	rrect.	
	С –	- Paramete	r missing or out	of range.	
	D –	- Comman	d not allowed.		
	Е –	- Home sec	quence already	started.	
	G –	<ul> <li>Displacer</li> </ul>	ment out of limi	ts.	
	Н –	- Comman	d not allowed in	NOT REFER	RENCED state.
	I –	- Comman	d not allowed ir	CONFIGUR	ATION state.
	J –	- Comman	d not allowed in	DISABLE st	ate.
	К –	- Comman	d not allowed in	READY state	2.
	L –	- Comman	d not allowed in	HOMING sta	nte.
	М –	- Comman	d not allowed in	MOVING sta	ate.
	N –	<ul><li>Current p</li></ul>	osition out of so	oftware limit.	
	S –	- Commun	ication Time Or	ıt.	
	U –	- Error dur	ing EEPROM a	ccess.	
	V –	- Error dur	ing command e	xecution.	

## TH — Get target position

Usage	Not Ref.	Config.	Disable	Ready	Motion	
	•	•	•	•	•	
Syntax	xxTH					
<b>Parameters</b>						
Description	xx [int] —	Controller	address.			
Range	<b>xx</b> —	1 to 31				
Units	<b>xx</b> —	None.				
Defaults	xx Missing:	Error B.				
	Out of range:	Error B.				
	Floating point:	Error A.				
Description	The TH comma positioner shou		he value of the	target positio	n. This is the positio	n where the
Errors	Α —	Unknown	message code	or floating po	int controller address	3.
	В —	Controller	address not co	rrect.		
	D —	Execution	not allowed.			
	н —	Execution	not allowed in	NOT REFER	ENCED state.	
	I —	Execution	not allowed in	CONFIGUR	ATION state.	
Rel. Commands	TP —	Get currer	nt position.			
Example	1TH	Get target	position of con	ntroller #1.		
	<i>1TH0</i>	Controller	r returns: targ	et position = (	) units.	

### TP — Get current position

Usage	Not Ref.	Config.	Disable	Ready	Motion
	•	•	•	•	•
Syntax	xxTP				
<b>Parameters</b>					
Description	xx [int] —	Controller	address.		
Range	xx —	1 to 31			
Units	xx —	None.			
Defaults	<b>xx</b> Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
Description	the positioner a	ctually is ac	cording to his	encoder value	ion. This is the position where e. In MOVING state, this value equal or very close to the target
	Together with the completed.	he TS comm	nand, the TP co	mmand helps	evaluating whether a motion is
Errors	Α —	Unknown	message code	or floating poi	nt controller address.
	В —	Controller	address not co	rrect.	
	D —	Execution	not allowed		
	н —	Execution	not allowed in	NOT REFER	ENCED state.
	I —	Execution	not allowed in	CONFIGURA	ATION state.
Rel. Commands	TH —	Get target	position.		
Example	1TP	Get currei	nt position of co	ontroller #1.	
	1TP0	Controller	returns: actu	al position = 0	units.

### TS — Get positioner error and controller state

Usage Not Ref. Config. Disable Ready Motion

• • • • • •

Syntax xxTS

Syntax XX1S

**Parameters** 

**Description** xx [int] — Controller address.

 Range
 xx
 —
 1 to 31

 Units
 xx
 —
 None.

 nn
 —
 None.

**Defaults** xx Missing: Error B.

Out of range: Error B. Floating point: Error A.

**Description** The TS command returns the positioner error and the current controller state.

**Returns** The TS command returns six characters (1TSabcdef). The first 4 characters (abcd) represent the positioner error in Hexadecimal. The last two characters (ef) represent the controller state.

**Error code (abcd):** Convert each hexadecimal to a binary:

F	Е	D	С	В	A	9	8	7	6	5	4	3	2	1	0
1111	1110	1101	1100	1011	1010	1001	1000	0111	0110	0101	0100	0011	0010	0001	0000

Each bit represents one possible error:

A	В	С	D
1 1 1 1	1 1 1 1	1 1 1 1	1 1 1 1
• Not used • Not used • Not used • Not used	• Not used • Not used • Not used • Not used	<ul> <li>No parameters in memory</li> <li>Not used</li> <li>Motion Time out</li> <li>Not used</li> </ul>	• Not used • Not used • Not used • Not used

#### Examples:

- Error map 0000 = No errors
- Error map 0020 = Motion time out

#### Controller states (ef):

- 0A: NOT REFERENCED from reset.
- 0B: NOT REFERENCED from HOMING.
- **0C**: NOT REFERENCED from CONFIGURATION.
- **0D**: NOT REFERENCED from DISABLE.
- 0E: NOT REFERENCED from READY.
- **0F**: NOT REFERENCED from MOVING.
- 10: NOT REFERENCED no parameters.
- 14: CONFIGURATION.
- 1E: HOMING.
- 28: MOVING.
- 32: READY from HOMING.
- 33: READY from MOVING.
- 34: READY from DISABLE.
- 3C: DISABLE from READY.
- 3D: DISABLE from MOVING.

#### NOTES

THE ERROR BUFFER GETS UPDATED PERIODICALLY, APPROX. EVERY 1 MS.

THE TS COMMAND READS THE ERROR BUFFER AND CLEARS THE ERROR BUFFER AT THE SAME TIME (SAME AS FOR COMMANDS TE, TB). SO WHEN LAUNCHING THE TS COMMAND, IT IS IMPORTANT TO PROCESS THE TS FEEDBACK ACCORDINGLY.

THE ERROR "NO PARAMETERS" GETS ONLY DETECTED DURING THE BOOTING OF THE CONTROLLER. WHEN READ THE ERROR IS CLEARED.

With no errors in the error buffer the color of the LED will change from red to either green or orange depending on the controller state.

**Errors** A — Unknown message code or floating point controller address.

B — Controller address not correct.

**Rel. Commands** TE — Get last error.

**Example** 1TS | Get error and state of controller #1.

1TS00000A | Controller returns: no errors and NOT REFERENCED from reset.

### VE — Get controller revision information

Usage	Not	Ref.	Config.	Disable	Ready	Motion
			•	•	•	•
Syntax	xxVE					
<b>Parameters</b>						
Description	xx [int]	_	Controller	address.		
	nn [stri	ing] —	Action.			
Range	XX	_	1 to 31			
Units	XX	_	None.			
Defaults	xx M	lissing:	Error B.			
	Out of	range:	Error B.			
	Floatin	g point:	Error A.			
Description	This co	mmand 1	returns the co	ontroller's revi	sion informati	on.
Errors	A	_	Unknown	message code	or floating poi	nt controller address.
	В	_	Controller	address not co	rrect.	
Rel. Commands	TP	_	Get curren	t position.		
Example	1	VE	Get contro	oller #1 revision	n information.	

IVE CONEX-AGP V1.0.0. | Controller returns revision number

### **ZT** — Get all configuration parameters

Usage	Not Ref.	Config.	Disable	Ready	Motion
	•	•	•	_	_
Syntax	xxZT				
<b>Parameters</b>					
Description	xx [int] —	Controller	address.		
Range	<b>xx</b> —	1 to 31			
Units	xx —	None.			
Defaults	xx Missing:	Error B.			
	Out of range:	Error B.			
	Floating point:	Error A.			
Description	The ZT comman	nd returns th	e list of all cur	ent configura	tion parameters.
			•		stage parameter and simplifies by using Hyper Terminal file
Errors	Α —	Unknown	message code	or floating poi	nt controller address
	В —	Controller	address not co	rrect	
Rel. Commands	TE —	Get error o	code.		
Example	1ZT	Get contro	oller #1 configu	ration data.	
	1PW1				
11	DB0.000075				
	1KP10				
	•••				
	1HT1				
	1PW0
